

Solutions in Audit

Audit is used to determine the effectiveness of each of the elements of the health and safety management system by making evidence-based judgements using observation, discussion, study of documentation, measurement and possibly photographic record. **Audit** makes judgements about the elements of policy, organisation, planning and implementing, measuring performance and reviewing performance.

Audit is independent, systematic, comprehensive, and importantly, based on secure evidence. JRL Solutions Ltd has developed systems which enable it to identify which issues are important and the priorities for the organisation and tailor the audit accordingly.

JRL Solutions Ltd determine whether an organisations' declared intentions fit its practice and identify both strengths and weaknesses. Judgements are only made where the evidence supports them. JRL Solutions Ltd is thorough in its approach and the final report can be relied on to provide a clear picture of how effectively the organisation is managing health and safety.

Each main heading of the report is subdivided into appropriate sub-headings. Evidence is collected by observational sampling methods, discussion and interview with key staff and a study of all relevant documentation.

The audit will enable an organisation to benchmark itself against sector standards and its competitors. It is a useful way of demonstrating commitment to clients, suppliers, employees and shareholders and thereby raises confidence. It can result in greater profitability and reduced costs.

● **JRL Solutions Ltd will carry out an audit** and make recommendations for improvements.
